Project One

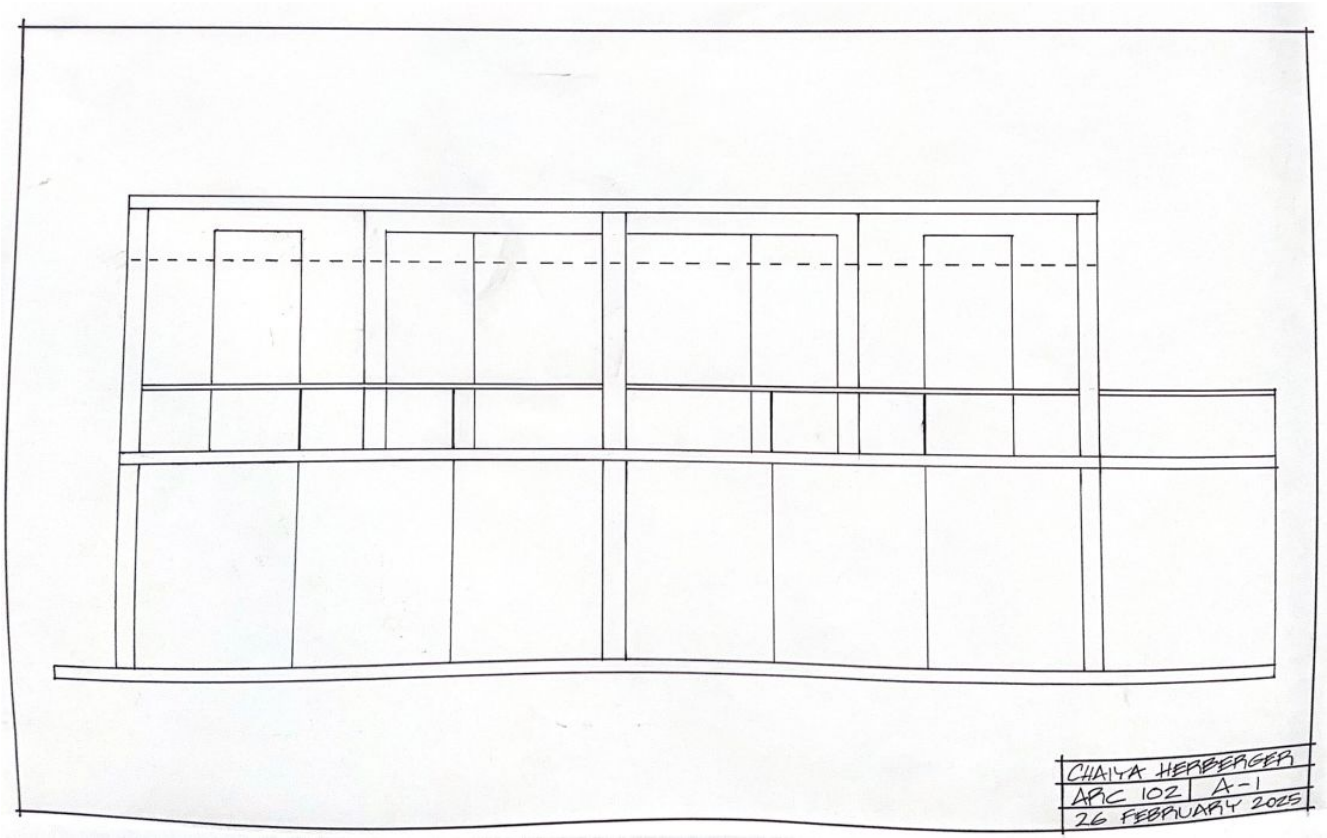

Reflection: Project One

Through the process of creating this parti model and the entire project as a whole, I really started to grasp the idea of not only what a parti model is and how to look at the parti of a structure, but also spatial composition, massing, and how simple geometric forms can convey architectural intent. By working with physical materials and not just pictures and plans, I learned the importance of precision and how minor shifts in alignment or how the pieces lay together affect the overall clarity of the project's form. This project taught me how to translate the abstract ideas of things (such as circulation, private/public areas of a building, etc) into a tangible three-dimensional model, one that emphasizes hierarchy, proportion, volumes.

Project Two

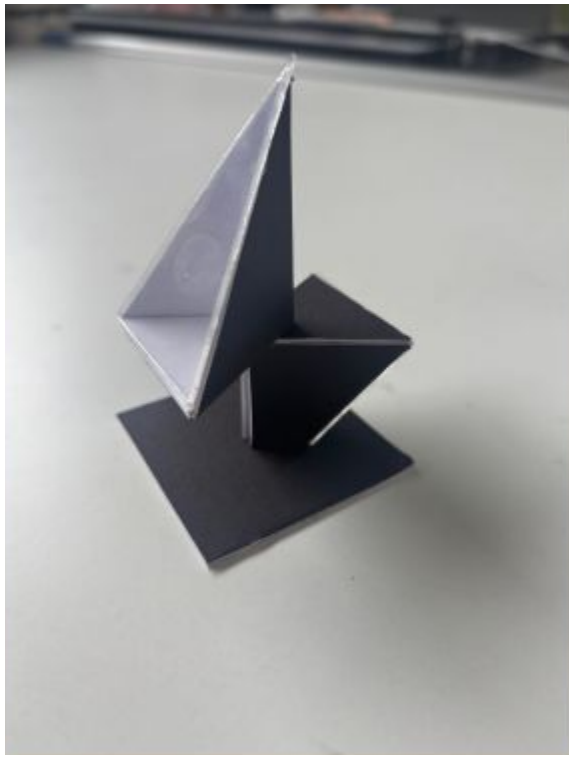

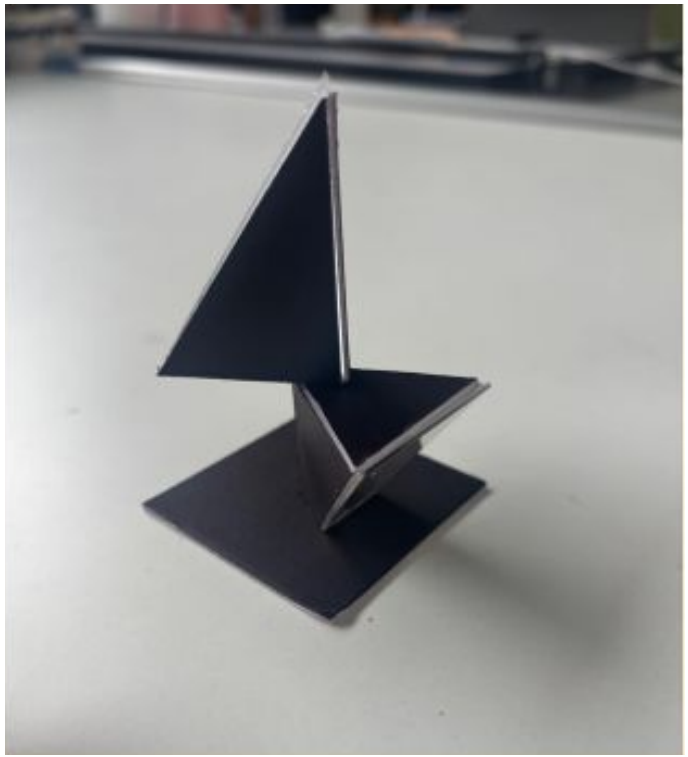

Project Two

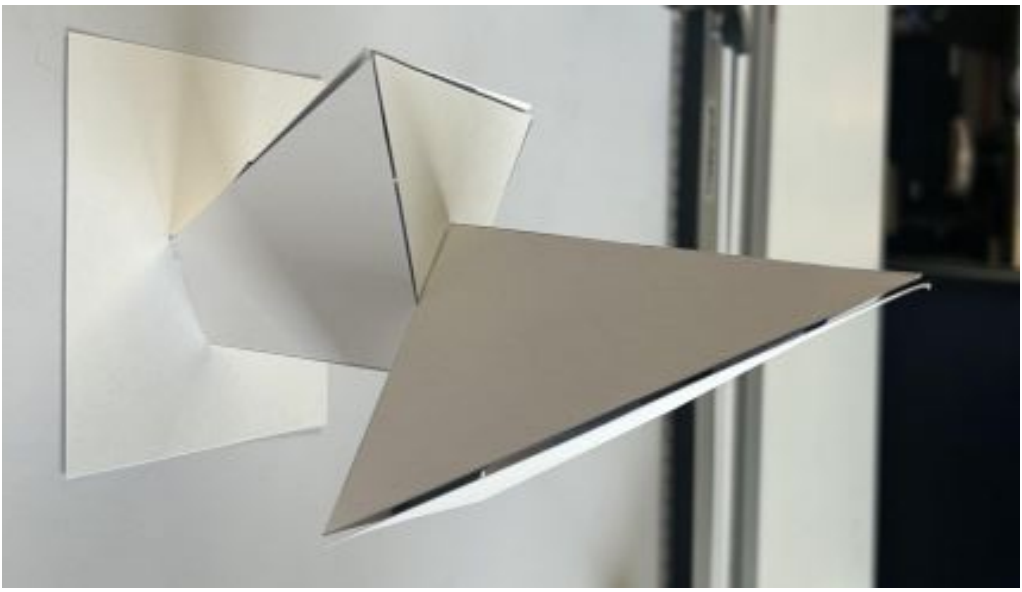

Reflection: Project Two

This project forced me to learn how to design a structure based loosely off of another. In past projects we have been free to design with no other original design in mind, and no site to work with. This was the first project where we actually used the site as part of our design process. This helped me to learn about the importance of not only making the building look aesthetically pleasing, but to also understand how a building will be placed onto a site. Keeping in mind direction of the roads, trees, sidewalks, and other various “landmarks” of sorts.

Project Three

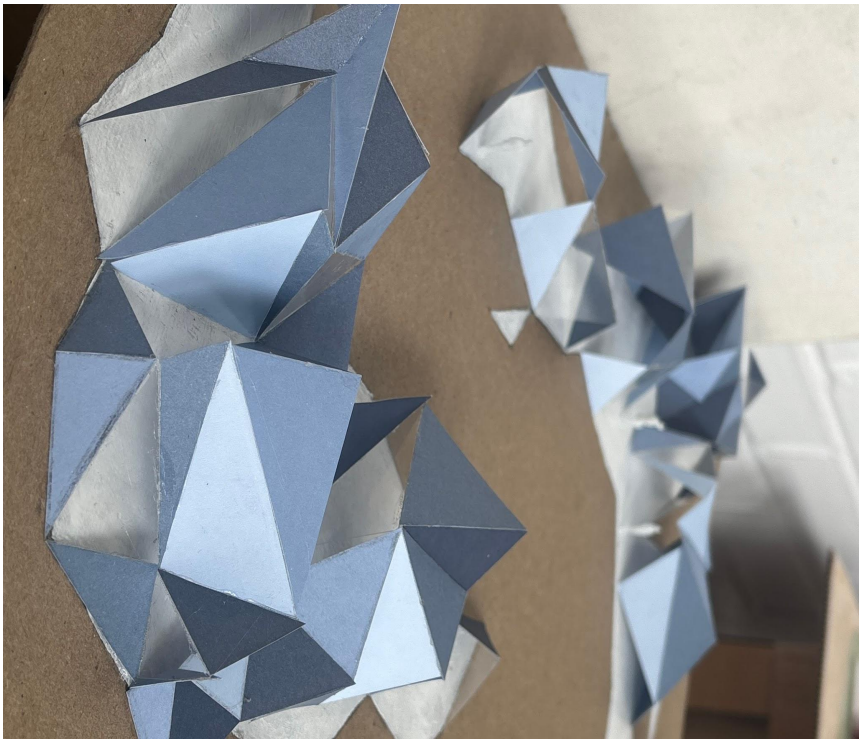

Reflection: Project Three

Creating this smaller model and working on a smaller scale made it a lot easier to come up with many different designs. Also, working on a smaller scale helped me realize that even working at this reduced size can convey a very large structure if done correctly. It pushed me to pay attention to proportion, alignment, and craftsmanship while working on this model. This project was also unique because we had to work with other people during this entire design process. I learned how to communicate my ideas better, learn how to work with others while creating a single structure, and how to come to one conclusion/solution, compromising, while working with multiple people.

Project Four

Reflection: Project Four

During this final review, I was able to gather helpful information about my project and how to approach future projects. Some things I believe that were ultimately successful within my design and design process was the color palette, the construction, and the concept. The color palette was a muted blue palette with varying shades, this helped create the illusion of depth even further than the folds of the triangles, more aesthetically, it also was a very pleasing color scheme on the eyes. The concept overall came out really interesting, it was something that caught a lot of people's eyes. The folded triangles brought interest as well as familiarity, triangles are used all the time in structures so it was able to be integrated well. Some things that could have been worked on was relating the idea to the department "sponsoring" the project better, working on the most ideal materials, and thinking about the surrounding buildings better. My concept was very loosely related to ETBD, and it probably would have done better to include some sort of digital/technological element into the design. The materials I chose were interesting but maybe not the best choice for those who would have to engineer the canopy, although a light weight concrete, concrete would still be a difficult endeavor for the way my project was constructed. Although my canopy was built with the paths of the people walking in mind, it did not take into account the people coming in and out of the buildings as much as it could have. All of the things here are things I should and will keep in mind moving forward with other projects, all the comments were very insightful and overall worth reflecting on.
